Lot

IRI

<http://www.w3id.org/ecsel-dr-S0#Lot>

Definition

The Lot entity represents a manufacturing unit (e.g. in the semiconductor industry in Frontend this consists of 25 or 50 wafers). More generally, a lot is a set of wafers, substrates or modules that travel together through the FE or BE fab in order to fulfill a certain order.

Subclass of

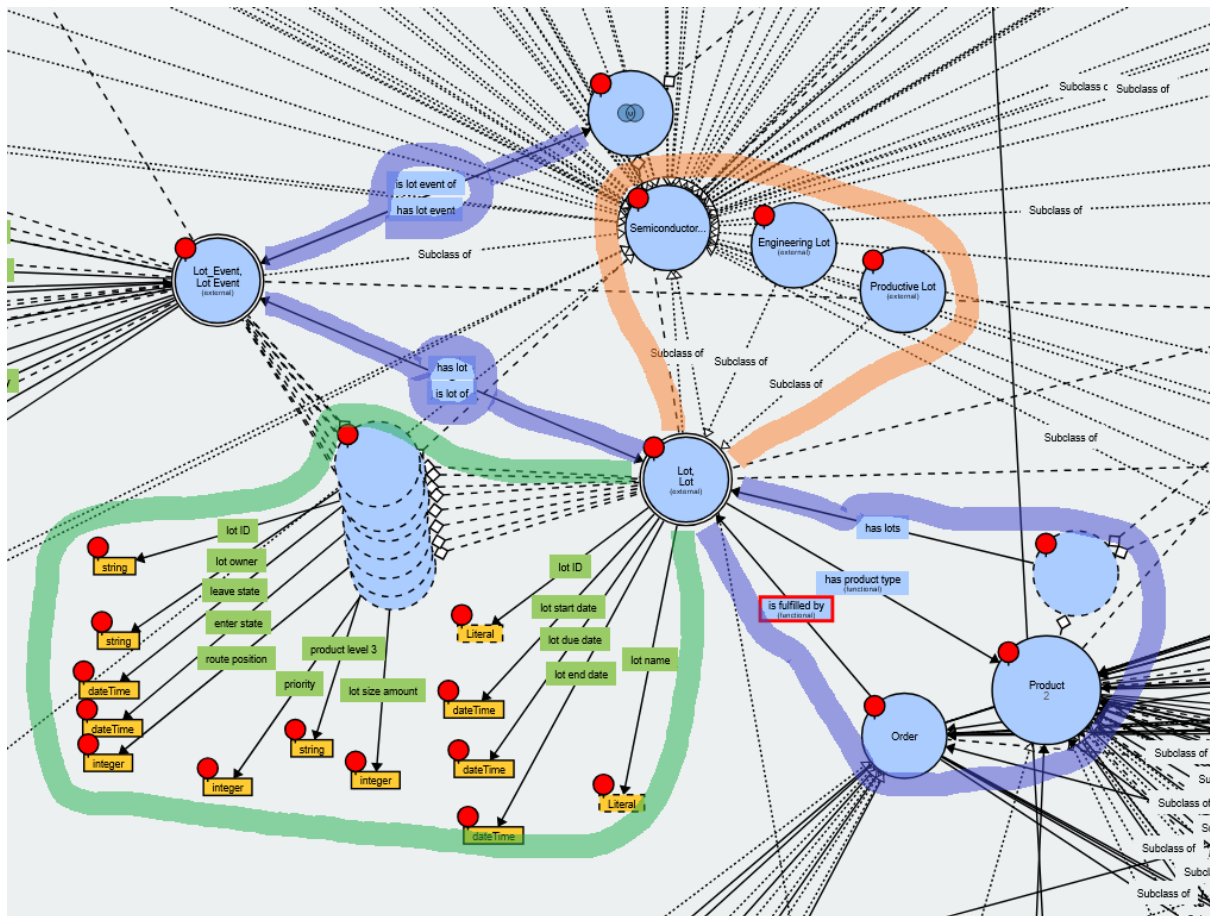

Semiconductor Production Lobe

http://www.w3id.org/ecsel-dr#Semiconductor_Production_Lobe

Relationship

(Lot) has product type (Product)

http://www.w3id.org/ecsel-dr-DF#has_product_type

Product

IRI

<http://www.w3id.org/ecsel-dr#Product>

Definition

A product is any tangible output or service that is a result of a process and that is intended for delivery to a customer or end user. A product is something that is produced with effort (e.g. by mechanical or industrial processes) and sold to a customer. A product is either tangible (physical product) or intangible (service). A set of alternative BOMs might be associated with each product. The manufacturing process is complicated by binning and substitution (in production). Binning refers to the process that an item can become one of several products based on tested levels of performance, for instance, speed.

Subclass of

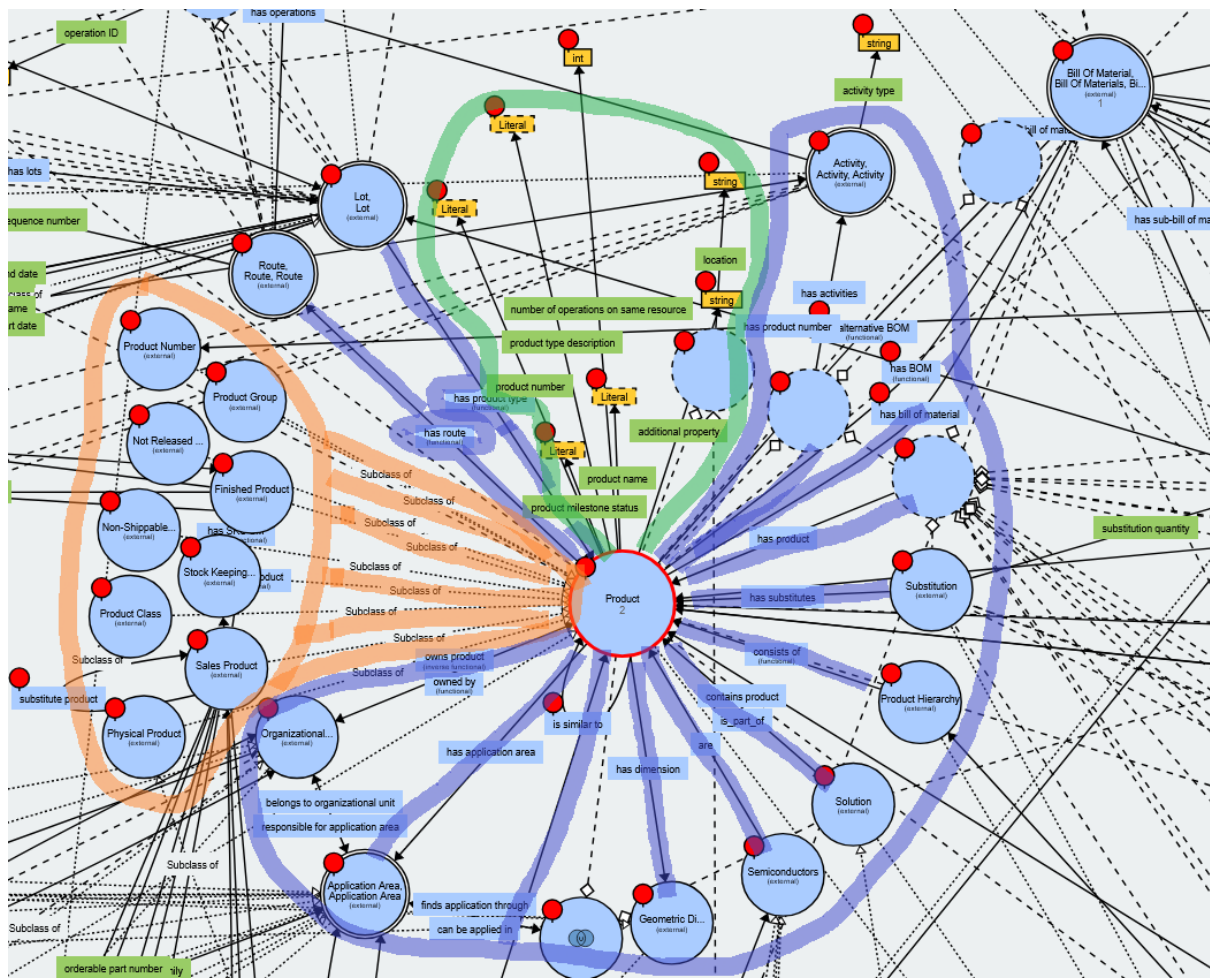

Product Lobe

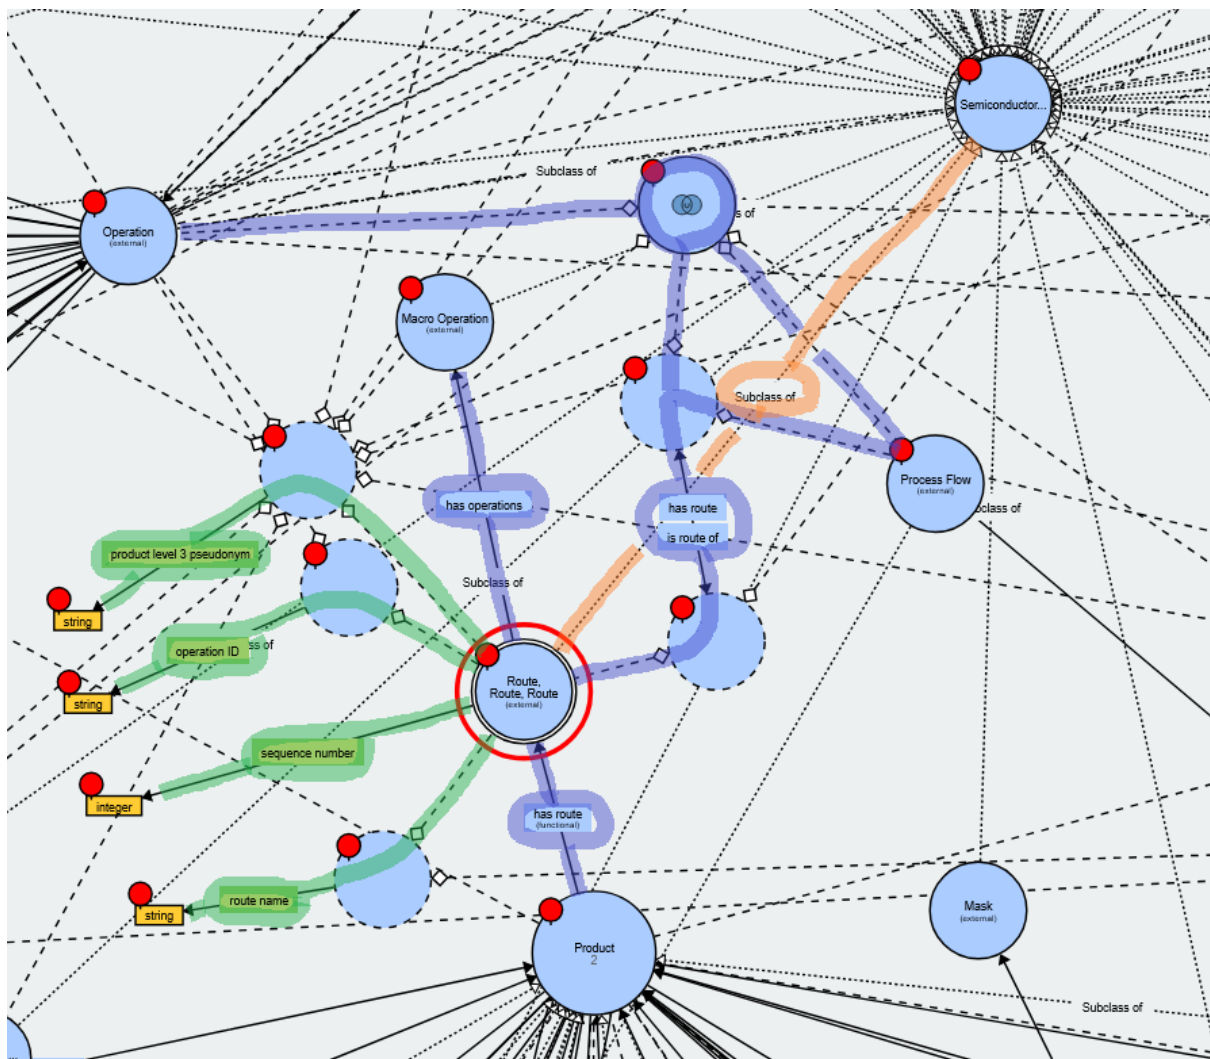

http://www.w3id.org/ecsel-dr#Product_Lobe

Relationship

(Product or Solution) can be applied in (Application Area)

http://www.w3id.org/ecsel-dr-OOSMP#can_be_applied_in

Definition

An Equipment Group is a group of same type of machines for production of certain production steps. Each machine is allocated to a group of machines doing similar processes. The equipment groups are described and allocated in the master entity "Equipment Group".
